SUMMARY

Senior backend engineer, seven years building Python services that other teams depend on. Most recently responsible for the payments API at a company where downtime is measured in lost transactions.

TECHNICAL SKILLS

Python, FastAPI, Django, PostgreSQL, SQL, REST API design, Redis, Docker, Kubernetes, AWS (EKS, RDS, S3, Lambda), Terraform, CI/CD, GitHub Actions, pytest, OpenTelemetry, Grafana

EXPERIENCE

Senior Software Engineer - Safepay

Mar 2022 - Present

- Own the payments API: FastAPI on PostgreSQL, roughly 1.2M requests a day.
- Led the move from a monolith to four services over nine months. Did it with the strangler pattern so there was never a big-bang cutover.
- Reduced p99 latency on the authorisation endpoint from 840ms to 190ms by replacing an N+1 query pattern and adding two composite indexes.
- Designed the idempotency layer that stopped duplicate charges. This was the single most common support ticket before, and is now roughly zero.
- Mentor two mid-level engineers and run the weekly design review.

Software Engineer - Careem

Jun 2019 - Feb 2022

- Built REST services in Python for the driver-earnings platform.
- Migrated batch reporting from nightly cron scripts onto Airflow, which cut the reporting delay from 24 hours to under 1.
- Introduced contract tests between our service and two downstream consumers after a breaking change caused a Friday incident.

Software Engineer - Systems Limited

Aug 2018 - May 2019

- Django and PostgreSQL work on an enterprise inventory product.

EDUCATION

BS Computer Science, FAST National University, 2018

OTHER

- Speaker, Python Pakistan meetup 2024: "Idempotency is a design problem".
- Maintainer of a small open-source library for Postgres advisory locks.
